1) Have any data been collected for this study already?

No, no data have been collected for this study yet.

2) What's the main question being asked or hypothesis being tested in this study?

We will explore whether healthcare providers (HCPs) in the treatment condition of an empathic intervention respond differently to HCPs in the control condition. All study procedures and items are being pre-registered for this study.

3) Describe the key dependent variable(s) specifying how they will be measured.

None; All are exploratory

4) How many and which conditions will participants be assigned to?

Participants will be randomly assigned to one of two conditions: 1. Treatment condition, where participants will read about and respond to items related to providing healthcare, and using an empathic mindset approach to building relationships with patients and providing care; 2. Control condition, where participants will read about and respond to items related to using technology in their personal life.

All participants will then engage with a series of mock telehealth visits with a low-SES patient and respond to several items. All participants will then respond to demographic questions and additional dependent variables.

5) Specify exactly which analyses you will conduct to examine the main question/hypothesis.

We will conduct linear regressions with experimental condition as the categorical predictor. We will also explore the moderating role of demographic variables (defined below).

6) Describe exactly how outliers will be defined and handled, and your precise rule(s) for excluding observations.

Participants will be removed if they fail to identify the correct name of the patient in the mock telehealth portion of the study.

7) How many observations will be collected or what will determine sample size? No need to justify decision, but be precise about exactly how the number will be determined.

200

8) Anything else you would like to pre-register? (e.g., secondary analyses, variables collected for exploratory purposes, unusual analyses planned?)

We are pre-registering all of the survey items.

Manipulation checks: "Patients will take advantage of you if you ask for their input too often."; "Given all of the pressures that healthcare professionals face, it is not possible to prioritize making a significant effort to maintain a high-quality relationship with every single patient."; Name of patient

First impression of patient: Pain severity; Treatment decisions & dose

Repeated measures: Frustration; Initiative; Pain exaggeration; Deservingness; Difficult; Giving up; Lazy; Motivated; Importance of health improvement; Intelligence; Attributions; Treatment decisions & dose

Post-measures: Perceived patient SES (Subjective; Insurance; Income; Education); Interest in additional learning and trainings; Anticipated Professional Fulfillment (16 items); Petition signing; Donation amounts

Demographics: Years of experience; Specialty; Job title; State of employment; Exposure to low SES patients; Degree; Location of training (country or state); Age; Gender; Race; Subjective SES; Political affiliation; Income; Education; Mother + Father education
